APPENDIX C: RETAIL MODEL

## Introduction

This report summarizes an analysis of: 1) market conditions that pertain to Retail, Office, Hotel, Industrial, and Residential land uses for the Meredith International Centre Specific Plan area in Ontario; and 2) the long-term socioeconomic impacts of future development of combinations of these land uses within the Meredith site. The analysis compares the proposed Specific Plan Amendment (Proposed Project) to the land use mix and quantities planned for the project area under two other scenarios: The Ontario Plan (General Plan) and the 1981 Specific Plan. The essential difference between the Proposed Project and the General Plan scenario for the site is that the Proposed Project would have substantially less residential, retail, office and hotel development, and would largely replace these land uses with industrial development.

For purposes of this report, the long-term socioeconomic impacts of future development within the project area are framed in terms of the following major issues:

- Recurring fiscal impacts to the City's General Fund;
- Permanent employment opportunities (i.e., jobs based in the commercial and industrial facilities developed on site); and
- The project area's contribution to broader measures of community "balance," including housing diversity/affordability, jobs/housing ratio, and expanded availability of retail goods and services.

For all of the above issues, it is critical that potential impacts be evaluated in the context of the likely timing of future development under each of the land use scenarios under consideration. While the allowable land uses associated with a particular planning scenario may theoretically yield substantial fiscal benefits and employment opportunities, the actual benefits to the City and the community will depend on the depth and timing of market demand for the planned land uses. If there is limited demand for certain land uses, the associated socioeconomic benefits may be much less significant (or much further in the future) than the theoretical calculations would suggest. To address this fundamental tradeoff, The Natelson Dale Group, Inc. (TNDG) has completed the following analyses, documented in this report:

- A real estate market analysis to forecast the potential timing of demand (i.e., development absorption rates for the site) for each of the land uses under consideration;
- A time-phased fiscal impact analysis, which takes into consideration the potential buildout periods associated with each planning scenario for the site; and
- A time-phased analysis of the site's employment generation potentials under each planning scenario.

## Exec utive Summary

## The Basic "Tradeoff" Under Consideration

The analyses summarized in this report compare the proposed Specific Plan Amendment (Proposed Project) to the land uses planned for the project area under The Ontario Plan (General Plan). As an additional point of reference, the land uses associated with the 1981 Specific Plan for the area are also evaluated. The essential difference between the Proposed Project and the General Plan scenario for the site is that the Proposed Project would have substantially less residential, retail, office and hotel development, and would largely replace these land uses with industrial development.

The larger amounts of commercial development under the General Plan scenario would theoretically generate substantial fiscal and employment benefits, but - as described in greater detail below - the projected timing of market demand for commercial development on site would result in a very prolonged buildout timeframe for the General Plan land uses. In contrast, the industrial land uses that would constitute a large portion of the Proposed Project are typically associated with lower employment generation but could be built out much sooner based on projected demand. Thus, the basic "tradeoff" under consideration is that the General Plan scenario offers the theoretical, longer-term opportunity of creating substantial employment opportunities and fiscal benefits, whereas the Proposed Project offers benefits that would be lower but would occur much sooner.

To address this fundamental tradeoff, The Natelson Dale Group, Inc. (TNDG) has completed the following analyses, which are summarized in this Executive Summary and further documented in the report appendices:

- A real estate market analysis to forecast the potential timing of demand (i.e., development absorption rates for the site) for each of the land uses under consideration;
- A time-phased fiscal impact analysis, which takes into consideration the potential buildout periods associated with each planning scenario for the site;
- A time-phased analysis of the site's employment generation potentials under each planning scenario.

The intent of the time-phased analyses is to balance the theoretical nature of buildout calculations with market-based realities regarding development demand and timing. Specifically, the analysis considers potential impacts for two "levels of completion" for each scenario:

- Theoretical buildout; and
- Projected market-based development over the next 20 years.

In TNDG's opinion, the 20-year timeframe represents the most relevant point of discussion/comparison for purposes of the EIR socioeconomic impact studies. Economic projections beyond a 20 -year period are typically highly speculative (due to unpredictable shifts in demand, potential changes in the
competitive environment, etc.) and therefore would not provide a reliable basis for current decision making.

## Land Use Assumptions and Projected Absorption Rates

Table ES-1 (below) shows the land uses assumed for each of the three development scenarios under consideration (1981 Specific Plan, General Plan and Proposed Project). The analysis assumes that the industrial space in the proposed project would be occupied by the following tenant types:

- General warehousing (50\%)
- E-commerce fulfillment centers for which Ontario would be the "point of sale" for sales tax purposes (10\%)
- Other industrial, including manufacturing and "flex" space (40\%)

The above percentage allocations represent current demand patterns based on comparable industrial developments/markets recently evaluated by TNDG.

Table ES-1 (below) also shows the assumed absorption rates (and corresponding buildout years) for each land use on the site. These numbers represent average annual absorption over the 20-year analysis period and are based on TNDG's market analysis (as documented later in this report). The somewhat higher residential and retail absorption rates for the General Plan scenario reflect the assumption that the much larger scale of residential and retail development for this scenario would potentially allow the site the achieve higher market penetration.

For some land uses (especially the large amounts of planned office development under the 1981 Specific Plan and the General Plan), the buildout periods would be extremely prolonged (e.g., 136 years for the office space planned for the site under the General Plan). These long buildout periods represent theoretical extrapolations of the 20-year absorption rate until the maximum allowable development is fully absorbed. As noted previously, however, market forecasts extending beyond 20 years are highly speculative and should be regarded as general indicators of potential demand.

## Employment Generation Potentials

Table ES-1 (below) also summaries the employment generation potentials associated with each scenario. In terms of theoretical buildout, both the 1981 Specific Plan and the General Plan would generated substantially more onsite jobs than the Proposed Project (17,746 jobs, 30,285 jobs and 4,693 jobs, respectively. However, within the more relevant/realistic 20-year analysis horizon, the differences would be much less pronounced. Whereas projected market demand would allow the Proposed Project to be fully built out well before the end of the 20-year analysis period, the 1981 Specific Plan and General Plan development programs would be only $28 \%$ and $22 \%$ built out, respectively, by the end of the 20-year horizon. Total employment generation by Year 20 is projected at 5,011 jobs, 6,611 jobs and 4,693 jobs, respectively for the three scenarios.

## J obs Housing Balance

Table ES-1 (below) also forecasts the buildout and 20-year jobs/housing ratios within the project area. The City of Ontario is recognized regionally as an employment center or "jobs rich" community. Based on data from the Southern California Association of Governments (SCAG) ${ }^{1}$, Ontario's current (2012) jobs/housing ratio is 2.30 , which compares extremely favorably with the ratio (1.17) for the overall southern California region. At theoretical buildout, all three of the development scenarios for the subject site would have jobs/housing ratios that exceed the already-high citywide average ( 22.18 for the 1981 Specific Plan, 10.24 for the General Plan, and 6.18 for the Proposed Project). Thus, development of the proposed site would increase the City's overall jobs/housing ratio. For the more realistic 20-year forecast, the jobs/housing ratio for the 1981 Specific Plan (6.26) and the Proposed Project (6.18) would exceed the existing citywide average, but the ratio for the General Plan (2.24) would be slightly lower than the existing average.

## Summary of Fiscal Impact Analysis

Tables ES-2A, 2B and 2C (below) summarize the fiscal impact analysis for the three project scenarios. Table ES-2A (below) provides a detailed breakdown of annual General Fund revenues and costs associated with theoretical buildout of each scenario. Table ES-2B (below) provides revenue and cost projections associated with the 20-year (market-driven) development scenarios. Table ES-2C (below) summarizes the net fiscal impact of each scenario in terms of the following measures:

- Net annual benefit at theoretical buildout
- Net annual benefit in Year 20
- Cumulative net cash flow for Years 1-20
- Net Present Value (NPV) of the projected 20-year cash flow to the General Fund

The NPV calculations reflect the concept of the "time value of money" (i.e., a dollar today is worth more than a dollar 20 years from now). This component of the analysis is based on year-by-year cash flow projections (provided in Appendix B) associated with each development scenario.

Whereas the General Plan scenario would theoretically yield a significantly larger fiscal benefit to the City than the 1981 Specific Plan or Proposed Project scenarios, the Proposed Project would fiscally outperform the other scenarios in the more realistic (market-based) 20-year analysis. The Proposed Project's superior fiscal impacts are especially pronounced in the NPV cash flow comparison, reflecting the fact that much of the potential commercial development for the 1981 Specific Plan and General Plan scenarios would occur late in the 20-year period (compared to more immediate industrial development under the Proposed Project).

## Analysis of Broader Measures of Community "Balance"

The City's General Plan incorporates a number of policies that relate to the overall economic balance of the community. For purposes of this report, these issues are briefly discussed in terms of the following measures:

- Jobs/housing balance (discussed above);
- Housing diversity and affordability; and
- Availability of retail goods and services in the community.

Housing. Since the specific housing development program that would be pursued under each scenario is not defined, it is not possible to provide a definitive analysis of housing issues in this report. However, allowable development densities (per the relevant planning documents) and current market trends allow for general conclusions about the types of housing products that are likely to be developed on the site. Per TNDG's market analysis, it is assumed that housing within the project area would be developed at a density of approximately 40 dwelling units per acre and in Type III (stick frame) buildings not exceeding five stories in height. Based on current market patterns, rental housing is more likely than for-
sale housing, although this could change over the course of the buildout period (especially for the General Plan scenario which has a much larger number of residential units).

As a general conclusion (in the absence of specific information about housing product types to be developed), higher-density rental housing is more likely to meet affordability standards (even at market rent levels) than lower-density single-family development. As such, the project is likely to contribute to the City's overall supply of affordable housing, and this conclusion would especially apply to the General Plan scenario since it would include nearly four times as many residential units as the other scenarios.

Retail Goods and Services. Ontario is regionally recognized as a destination for retail shopping. TNDG's market study indicates that the potential exists for the City to continue to expand its retail base in the future. Although the potential land use mixes for the project area do not include substantial (regional-scale) amounts of retail development (with the potential exception of the General Plan), they would potentially enhance community "balance" in the following ways: (a) providing onsite shopping opportunities for project area residents, and (b) taking advantage of the site's strategic freeway location to serve specific market niches (i.e., showroom retail, possibly related to office and industrial firms in the project area). The General Plan scenario would potentially allow for a much larger amount of retail development in the project area (over 2 million square feet, per the assumptions of this report). However, TNDG's market analysis indicates that this amount of retail space would likely require an extremely long buildout period (over 35 years), and as such the potential enhancement to the City's retail mix under the General Plan scenario should be considered speculative.

Table ES-2A. Summary of Annual Impacts to the City of Ontario's General Fund at Theoretical Buildout, Meredith International Centre

| General Fund | 1981 <br> Specific Plan <br> Impact | General Plan <br> Impact | Specific Plan <br> Amendment <br> Impact |

## Summary of current and future market demand indic ators for Office, Industrial, Hotel, Retail, and Residential space at the Meredith International Centre Specific Plan area in Ontario

The purpose of this section of the report is to summarize various indicators of demand for Office, Industrial, Hotel, Retail, and Residential space at the Meredith site in Ontario, based on readily available data and adaptations of TNDG demand models, calibrated to those data. The analysis is focused on the site configuration represented by the Specific Plan Amendment scenario, but also addresses the two previous plan configurations for the site, the 1981 Specific Plan and the General Plan.

The following prior studies pertaining to the site were reviewed:
Keyser Marston: Draft Memorandum to City of Ontario, May 3, 2013
The Concord Group: Market Absorption and Economic/Fiscal Revenue Impact Analysis for the Meredith Property in Ontario, California, July 17, 2012

Beacon Economics: An Economic Analysis, Meredith Site Options in Ontario, California, 2013
Findings relevant to this analysis are summarized in Appendix A. The review indicated that the bases for projecting demand varied widely among the reports. For example:

- Keyser Marston figures, for which they cite Beacon Economics as a source (from a document other than the Beacon study cited above) show very aggressive growth in the Ontario area (including areas outside the City) in future time segments (beyond 2020) for both office and Industrial uses. For example, office-related employment is projected to more than double from 2013 to 2033, and industrial employment more than triple. In contrast, official projections from the California Employment Development Department reflect a 42 percent increase in total employment in the Inland Empire from 2012-2035, and projections of total employment for Ontario by the Southern California Association of Governments (SCAG) indicate total employment and industrial-space-using employment approximately doubling for the 23-year period of 2012 to 2035.
- Among the reports, employee density factors by uses varied from as low as 80 square feet per worker for office space to over 8,000 square feet for one type of industrial use.
- Both Keyser Marston and Concord expect residential absorption at the site to be 1,000 units or less over 10 years. Beacon recommends 1,535 units for the site, which it expects to be absorbed in 5-7 years.

The reports were essentially in agreement that Ontario has an "oversupply" of retail. However, this does not necessarily mean that Ontario should not have more retail. If city businesses are doing a good job of serving residents outside city boundaries, perhaps this trend should continue or even accelerate.

## 1 Office/Industrial

A particular challenge of this study is to interpret the space-demand implications of two critical factors: 1) the mix of Industrial land use types anticipated in Ontario and at the site, and 2) the changing nature of warehouse use (and manufacturing also although this is less of an issue here) and especially the density of employees at typical facilities. For purposes of TNDG's demand analysis model, and the related estimated fiscal impacts, the following industrial-use mix and employment-density factors were applied (the table also appears below in the discussion of the TNDG demand-projection model), based on TNDG's review of numerous indicators: ${ }^{2}$

| Use type | Square feet <br> per worker | $\%$ allocation of <br> ind. space |
| :--- | ---: | ---: |
| Office | 175 |  |
| Industrial mix: |  |  |
| Warehousing | 3,000 | $50 \%$ |
| E-Commerce | 1,500 | $10 \%$ |
| Manufacturing and <br> other Industrial | 1,500 | $40 \%$ |

Data for recent absorption activity for the land uses analyzed were not readily available but could be inferred by means of published reports by the real estate brokerage firm Voit (a four- to five-year history). These kinds of reports are intended primarily to inform brokerage clientele of current market conditions and general trends; consequently their use as a "research" source is limited. Historic data from these sources are very limited, generally to what is included here. The data are most useful for relative comparisons, for example comparing Ontario with the Inland Empire, the level of office activity compared to industrial, and occupancy rates and other factors - all of which help sensitize the forecasting. Given that absorption data cited here cover a timeframe (2010 through mid-2014) roughly corresponding to the prolonged recovery period for the Great Recession (and therefore may not be

[^1]reflective of future trends), this analysis does not use historic absorption data as the primary basis for future demand forecasts. The actual office/industrial space forecasting in TNDG's analysis is based on employment projections. Notwithstanding these limitations, the available VOIT reports do provide the following insights:

- Annual net absorption of office space in Ontario ranged from 86,000 to 192,000 square feet, for 2010 through 2013 (and figures for the first half of 2014 suggest that that space absorption will be at the high end of the range).
- Annual net absorption of industrial space in Ontario ranged from a negative 1.8 million square feet to a positive 4.3 million square feet, for 2009 through 2013 (and figures for the first half of 2014 suggest that that space absorption will be about 2 million square feet).
- Vacancy rates for both office and industrial decreased from 2009-10 through 2014, and Ontario's rates were higher than the Inland Empire's for office space and generally lower for industrial. Office vacancy rates were consistently higher than industrial space over the time period; in 2014 Ontario's industrial vacancy rate was under 4 percent, while the office rate was under 20 percent.
- Ontario had about 11 percent of the regional (Inland Empire) total inventory of office building area, and 11 to over 50 percent of the net office absorption for the years 2010-2014. In other words, Ontario appears to be capturing a disproportionate share of absorption activity in the total region for all of the years shown. In terms of square feet planned, Ontario's share, at 35 to 47 percent, is also disproportionately higher. For most years, the same is true of space under construction.
- Ontario had about 21-22 percent of the regional (Inland Empire) total inventory of industrial building area, and, except for 2 years of negative net absorption (in which the Inland Empire total was also low for one of the years), 28 to 35 percent of the net absorption for the years 2009-2014. In other words, Ontario is capturing a disproportionate share of net absorption activity in the total region for most of the years shown. However, in terms of square feet planned, Ontario's share is relatively low, which at least in part could be due to limited supply of developable land.

TNDG prepared an assessment of demand for office and industrial space using a demand model with the following components:

- Existing employment, and projected employment growth, by economic sector, for the Inland Empire (San Bernardino and Riverside Counties), as prepared by the California Employment Development Department (EDD), and existing sectoral employment and projected growth in total employment for Ontario, from the Southern California Association of Governments (SCAG). Because of the level of detail for the two geographic areas differed among the two data sources (SCAG and EDD), and the two sources are not directly comparable, it was necessary to reconcile the source data for analysis purposes.
- Ontario's estimated share of the Inland Empire's projected space demand, and the Meredith site's estimated share of Ontario's projected development demand.
- Assignments of employment by sector into office, industrial, and "other" land uses types (TNDG model).
- Allocations of industrial space and employment density by industrial sub-type (Warehousing, ECommerce, and Other Industrial), as discussed above.

The model results are summarized in the following series of tables.

### 1.1 Employment Forecasts by Industry

Table 1-1 (below) shows employment projections for the Inland Empire, which formed the basis for the Ontario forecasts, shown on Table 1-2 (below).

Table 1-1. Employment Forecasts by Industry Group, Riverside and San Bernardino Counties (Inland Empire)

| Industry Group | $\mathbf{2 0 1 0}$ | $\mathbf{2 0 1 4}$ | $\mathbf{2 0 2 0}$ | $\mathbf{2 0 3 5}$ |

## Distribution of Office and Industrial Employment by Industry

The next step in the analysis identifies the percentage of employment attributable to office or industrial space (i.e. as a type of use) by industry, shown in Table 1-3 (below). The distribution percentages were derived by TNDG based on long-term studies of office and industrial demand conditions, related to employment growth, across southern California.

Table 1-3. Allocation of Office and Industrial Employment by Industry

| Industry Group | Percentage Distribution of Employees in Space Types by Industry: |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Office | Industrial |  |  |
|  | Space | Space | Other (1) | Total |
| Natural Resources, Mining, \& Construction | 0.0\% | 50.0\% | 50.0\% | 100.0\% |
| Manufacturing | 0.0\% | 100.0\% | 0.0\% | 100.0\% |
| Wholesale Trade | 0.0\% | 100.0\% | 0.0\% | 100.0\% |
| Retail Trade | 0.0\% | 5.0\% | 95.0\% | 100.0\% |
| Transportation \& Utilities | 0.0\% | 50.0\% | 50.0\% | 100.0\% |
| Information | 75.0\% | 25.0\% | 0.0\% | 100.0\% |
| Financial Activities | 90.0\% | 0.0\% | 10.0\% | 100.0\% |
| Professional \& Business Services | 50.0\% | 20.0\% | 30.0\% | 100.0\% |
| Educational \& Health Services | 50.0\% | 0.0\% | 50.0\% | 100.0\% |
| Leisure \& Hospitality | 5.0\% | 0.0\% | 95.0\% | 100.0\% |
| Other Services | 5.0\% | 50.0\% | 45.0\% | 100.0\% |
| Government (2) | 0.0\% | 0.0\% | 100.0\% | 100.0\% |

1. "Other" category includes for example retail space, hotels, government buildings, and employment that occurs outdoors and in other non-specific locations.
2. The assumption applied within this allocation process is that only government uses in privately owned buildings would be included in the Office Space category. Source: The Natelson Dale Group, Inc.

## Projected Employment by Land Use Category

The projected office and industrial employment figures are a product of the "allocation" table (above) and the preceding employment-by-sector tables. The projections for Inland Empire are shown below in Table 1-4 (below). The data reveal that office-using employment in the entire Inland Empire is expected to increase from 201,416 in 2014 to 296,720 by 2035, an increase of 47 percent. Industrial-space-using employment is projected to increase from 268,929 in 2014 to 385,694 in 2035, representing a 43 percent increase. "Other" employment, representing all other nonfarm industries, is expected to increase at a slightly higher rate than Industrial, and a lower rate than Office, over this same period.

Table 1-4. Projected Employment by Land Use Category, Inland Empire

| Land Use Category | Total Employment |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |
|  | 2010 | 2014 | 2020 | 2035 |
| Office | 185,400 | 201,416 | 225,440 | 296,720 |
| Industrial | 252,855 | 268,929 | 293,040 | 385,694 |
| Other | 687,545 | 733,415 | 802,220 | 1,055,866 |
| Total Nonfarm Employment | 1,125,800 | 1,203,760 | 1,320,700 | 1,738,280 |

Source: The Natelson Dale Group, Inc.
Table 1-5 (below) highlights the incremental change in Office, Industrial and Other employment in the Inland Empire by time interval. The largest absolute increases for each of the employment categories, even allowing for the longer interval, are projected to occur between 2020 and 2035.

Table 1-5. Projected Change in Office and Industrial Employment by Time Period, Inland Empire

| Land Use Category | 2014-2020 | 2020-2035 |
| :--- | ---: | ---: |
|  |  |  |
| Office | 24,024 | 71,280 |
| Industrial | 24,111 | 92,654 |
| Other | 68,805 | 253,646 |
|  |  |  |
| Total Change in <br> Employment | $\mathbf{1 1 6 , 9 4 0}$ | $\mathbf{4 1 7 , 5 8 0}$ |

### 1.2 Projected Demand for New Office/Industrial Space

Given the projected Office and Industrial employment figures in Table 1-5 (above), the next portion of the analysis translates the employment estimates into supportable square footages for each use type. Table 1-6 (below) shows the square-feet-per-employee factors that were used in the conversion process. The right-hand column shows how three different categories of industrial-space use were allocated in the demand model. This allocation aligns with employment-by-sector projections as tabulated above.

Table 1-6. Square Footage per Employee by Land Use Type

| Use type | Square feet <br> per employee | $\%$ allocation of <br> industrial use |
| :--- | ---: | ---: |
| Office | 175 |  |
| Industrial |  |  |
| Warehousing | 3,000 | $50 \%$ |
| E-Commerce | 1,500 | $10 \%$ |
| Other Industrial | 1,500 | $40 \%$ |

Source: The Natelson Dale Group, Inc.
Based on the preceding factors, Table 1-7 (below) displays the estimated demand for new Office and Industrial space for the Inland Empire through 2035. New supportable office space is expected to increase by a total of 18.3 million square feet during the projection period, most of this within the 20202035 period. Demand for industrial space is projected to increase by 248.6 million square feet between 2014 and 2035, most of this within the 2020-2035 period.

Table 1-7. Projected Increase in Demand for New Office and Industrial Space, Inland Empire

|  |  | 2014-2020 | 2020-2035 | Total, 20142035 |
| :---: | :---: | :---: | :---: | :---: |
| Office Demand |  |  |  |  |
| Demand for New Space |  | 4,204,200 | 12,473,960 | 16,678,160 |
| Construction Demand @ | 110\% | 4,624,620 | 13,721,356 | 18,345,976 |
| Net Demand for New Space |  | 4,624,620 | 13,721,356 | 18,345,976 |
| Industrial Demand |  |  |  |  |
| Demand for New Space |  | 48,897,098 | 187,901,432 | 236,798,530 |
| Construction Demand @ | 105\% | 51,341,953 | 197,296,504 | 248,638,457 |
| Net Demand for New Space |  | 51,341,953 | 197,296,504 | 248,638,457 |

Note that construction demand at 110-105\% allows for a $90-95 \%$ stabilized occupancy rate, respectively for Office and Industrial space. The different occupancy levels reflect market trends.

## Projected Demand for New Office/Industrial Space, Ontario

The following table shows the estimated projected new demand for Industrial and Office space in Ontario. The space estimates were calculated based on Ontario's proportion of Inland Empire space demand as of 2035: 9.6 percent for Office demand and 15.4 percent for Industrial space.

Table 1-8 (below) indicates a projected net increase of 1.8 million square feet of office space by 2035, and 38.4 million square feet of industrial space. Based on these projections, an average of 74,000 to 88,000 square feet of new office space could be added per year, and 1.3 million to 2.0 million square feet of industrial space, respectively during the two time intervals shown.

Table 1-8. Projected Demand for New Office and Industrial Space, City of Ontario

|  |  | $2014-2020$ | $2020-2035$ | Total, 2014- <br> 2035 |
| :--- | ---: | ---: | ---: | ---: |
| Office Demand |  |  |  |  |
| Demand for New Space |  | 404,931 | $1,201,439$ | $1,606,370$ |
| Construction Demand @ | $110 \%$ | 445,424 | $1,321,583$ | $1,767,007$ |
|  |  |  |  |  |
| Net Demand for New Space |  | 445,424 | $1,321,583$ | $1,767,007$ |
| Average per year |  | 74,237 | 88,106 |  |
|  |  |  |  |  |
| Industrial Demand |  | $7,553,495$ | $29,026,520$ | $36,580,015$ |
| Demand for New Space |  | $7,931,170$ | $30,477,846$ | $38,409,016$ |
| Construction Demand @ |  |  |  |  |
|  |  | $7,931,170$ | $30,477,846$ | $38,409,016$ |
| Net Demand for New Space |  | $1,321,862$ | $2,031,856$ |  |
| Average per year |  |  |  |  |

Note that construction demand at 110-105\% allows for a $90-95 \%$ stabilized occupancy rate, respectively for Office and Industrial space. The different occupancy levels reflect market trends.

## Allocation of demand to the Meredith site

TNDG estimated the share of office and industrial space demand that could reasonably be expected to occur at the Meredith site, based on the estimated totals for Ontario. The estimated share was based on the following office and industrial market conditions in Ontario:

- Existing office development near the Citizens Business Bank Arena (CBBA). This location could be more advantageous than the Meredith site for the following reasons:

0 The established base of multi-story office buildings in an attractive office-park environment gives the area a professional-office image.
o The retail, multi-family residential, and hotel development in and around this area enhances it "mixed use" functionality, giving office workers ample opportunities for close-by dining, shopping, housing.

0 The area has additional capacity for office and other development, and is also close to the Airport, with access from I-10 comparable to the Meredith site ${ }^{4}$.

[^2]- Few opportunities, comparable to the Meredith site in market orientation, appear to be available for additional industrial space development in other areas of Ontario. Several square miles of land are planned for industrial use (either as a designated use or by overlay designation) in the New Model Colony (NMC) area along the southern edge of the City in what is now a large agricultural area. However, industrial development in the NMC area will likely be many years in the build-out process. Given the level of current demand for industrial space, the Meredith site would likely be built out well before industrial development in the NMC area begins. In this regard, it should be noted that the two locations, from a market perspective, are not strongly competitive with each other and therefore would not directly impact each other's absorption potentials. An industrial user not choosing the Meredith site for one reason or another is more likely to go to another Inland Empire location (nearer the I-10/I-15 corridors) than to the NMC sites, especially in the near future. There may be strategic reasons for the City to promote industrial development in the NMC areas (e.g., to generate funding for needed NMC infrastructure), and this could eventually affect the competitive comparability of the two locations. However, the impact of such promotion efforts would probably not be enough, or soon enough, to deflect meaningful levels of demand from Meredith.

Based on the above observations, TNDG estimated the Meredith site's share of Ontario's potential new office space at 40 percent (with a lower rate for the 2014-2020 period while the property becomes established as an office location), and the site's share of the city's new industrial space (over the site's likely development period) at 85 percent. The results of this allocation are shown on Table 1-9 (below) for the time periods analyzed. The table shows that the Meredith site could potentially absorb an average of 26,000 square feet of office space annually up to 2020 , and 35,000 square feet annually for the period 2020-2035, or 156,000 square feet total by 2020 and (theoretically) another 529,000 square feet by 2035 .

According to the allocations on the table, the site could potentially absorb an average of over 1.1 million square feet of industrial space annually up to 2020, and 1.7 million square feet annually for the period 2020-2035, or 6.7 million square feet total by 2020 and another 26 million square feet by 2035.

Table 1-9. Projected Meredith site share of total Ontario demand, for Office and Industrial space, through 2035

|  | $2014-2020$ | $2020-2035$ | Total |

## 2 Hotel

Potential long-term demand for new hotel rooms is described below. Following from data provided in the KMA study, Table 2-1 (below) provides a range of new hotel room demand projections at the Meredith project site. As shown in the Table, the low scenario indicates that the site would be able to potentially support development of approximately 461 new hotel rooms over the next 21 years, by 2035. Under slightly more aggressive assumptions, as discussed below, the high scenario projects that the site would be able to support development of approximately 910 new hotel rooms. The following bullet points summarize the assumptions and rationale for these new hotel room demand projections:

- Table 2-1 (below) provides existing hotel room demand and supply for the combined two-city market area of Ontario and Rancho Cucamonga, as provided in the KMA study.
- Similar to the KMA study, the low projections assume that annual room demand in the market area will increase at a $2.0 \%$ annual rate. This is a reasonable growth projection factor for these types of long-term projections, for the following reasons. First, annual room sales in Ontario have increased at real (inflation-adjusted) rate of $2.2 \%$ over the 20-year period from 1993 to 2035. Second, SCAG is forecasting a $2.7 \%$ annual increase in employment in Ontario between 2020 and 2035, and employment growth is a primary driver of hotel room demand. The high scenario assumes a $3.0 \%$ annual growth rate (in relative terms, $50 \%$ higher than the low scenario) in new hotel room demand in the market area. Similar to the findings in the KMA study, TNDG believes that the high scenario would be more likely if the City were to gain control of the Ontario Airport, thereby increasing regional air traffic from existing levels. Given the site's proximity to the airport, it would be in a favorable position to capture increased hotel room demand resulting from additional flight travelers to the area.
- Based on TNDG's previous discussions with various hotel operators, this analysis assumes that new hotel development would occur once the market reaches a stabilized occupancy rate of 75\%.
- Based on the above factors, the long-term projections indicate that the total market area (Ontario/Rancho Cucamonga) would be able to support between 1,152 (low scenario) and 2,275 (high scenario) new hotel rooms by 2035.
- As shown in Table 2-1 (below), the demand projections assume that the Meredith site could capture approximately $40 \%$ of total new room demand in the market area. This site capture rate is equal to the office capture rate in this analysis. In addition, based on data from Dean Runyon Associates, Ontario accounts for approximately 80\% of total hotel room receipts in the combined two city market area. Thus, if we assume that Ontario will capture $80 \%$ of total new room demand in the market area, the Meredith site - given its favorable location characteristics (proximity to airport and highway orientation) - would be a strong candidate to capture a

[^3]significant portion of this demand. The $40 \%$ capture rate implies that the site would capture approximately $50 \%$ of the projected citywide demand for new hotel rooms.

Table 2-1. Demand for New Hotel Rooms, Meredith Site, 2013-2035

| Scenario | 2013 | 2018 | 2020 | 2022 | 2024 | 2026 | 2028 | 2030 | 2035 |

Average Meredith Site Capture, 2013-2035: 41 rooms per year
Rounded Absorption Rate Used for Fiscal Impact Analysis: 40 rooms per year ${ }^{6}$
Source: KMA, Meredith Site Market Overview, May 3, 2013; TNDG.
${ }^{6}$ Recent (2014) data from the Ontario Convention and Visitors Bureau (CVB) suggest that the local hotel market is recovering faster than TNDG's projections suggest. Per the CVB, Ontario's occupancy rate in 2014 had reached $72 \%$. It should be noted, though, that TNDG's analysis (based on the previous KMA analysis) covers a larger market area than just Ontario (the TNDG analysis evaluates the combined Ontario/Rancho Cucamonga area). Thus, the $72 \%$ factor from the CVB is not directly comparable to the occupancy rates shown on the table. Moreover, TNDG's conclusion that the Meredith site could absorb an average of 40 hotel rooms per year reflects demand levels that approach the "high scenario" on the table. Thus, notwithstanding the recent uptick in occupancy levels, TNDG does not believe that the projected absorption rate for Meredith of 40 rooms per year is too low.

The Natelson Dale Group, Inc.

## 3 Retail

This analysis evaluates potential demand for new retail space based on long-term citywide population forecasts, as prepared by the Southern California Association of Governments (SCAG). In addition to resident-generated demand, Ontario retailers capture a significant amount of "external" (i.e., nonresident) retail demand, given the existing concentration of regional and super-regional retail space in the City (e.g., the 1.5 million square-foot Ontario Mills regional outlet center). This estimate of external retail demand is based on an evaluation of potential resident demand and actual retail sales in the City ${ }^{7}$. Based on this comparison of potential resident retail demand and actual sales in the City, TNDG developed "sales attraction factors" by retail category (see Appendix C, Table C-9) to account for external retail demand captured by City retailers. To account for future growth in retail demand, TNDG has assumed that the rate of growth in external demand will increase in proportion to future population growth in the City. This assumption is based on the fact that the City's share of countywide of taxable sales has increased from $16.1 \%$ in 2000 to $18.2 \%$ in 2012 (the most recent year full-year taxable sales data are available from the California State Board of Equalization [BOE]), as shown in the chart below.

Figure 3-1. Ontario's Share of San Bernardino County Taxable Sales

Source: California State Board of Equalization (SBOE); TNDG.
Based on the above, Table 3-1 (below) shows potential demand for new retail space in the City of Ontario in 2020 and 2035 (see Appendix C for a derivation of these factors).

[^4]Table 3-1. Demand for New Retail Space, City of Ontario - 2020 and 2035

| Retail Category | Square Feet |  |  |  |  |
| :--- | ---: | ---: | :---: | :---: | :---: |
|  | 2020 | 2035 |  |  |  |
|  |  |  |  |  |  |
| GAFO* | $1,244,726$ | $5,319,940$ |  |  |  |
| Food and Beverage | 91,585 | 391,433 |  |  |  |
| Food Services and Drinking | 68,074 | 290,947 |  |  |  |
| Bldg. Matrl. and Garden Equip. and Supplies | 49,508 | 211,597 |  |  |  |
| Auto Parts | 22,562 | 96,428 |  |  |  |
| Services Space at 10\% of Total Space | 164,051 | 701,149 |  |  |  |
|  |  |  |  |  |  |
| Total Space |  |  |  | $\mathbf{1 , 6 4 0 , 5 0 5}$ | $\mathbf{7 , 0 1 1 , 4 9 4}$ |

*GAFO = General Merchandise, Apparel, Furniture/Appliances, Other/Specialty Source: TNDG, See Appendix C.

Table 3-1 (above) shows that the City would be able to support approximately 1.64 million square feet of new retail/services space by 2020. In 2035, the buildout year of the adopted SCAG forecasts, the City would be theoretically able to support approximately 7.0 million square feet of new retail/services space.

While the above projections show potential citywide retail demand in 2020 and 2035, Table 3-2, below, shows the potential demand for new regional/showroom retail space at the Meredith site. As shown in Table 3-2, demand for new regional/showroom retail space at the site is projected to range from approximately 123,038 to 287,088 square feet by 2020. By 2035, potential demand for new regional/ showroom retail at the site is projected to reach between approximately 525,862 and 1.2 million square feet ${ }^{8}$.

[^5]Table 3-2. Demand for new Regional/Showroom Retail Space, Meredith Site - 2020 and 2035

| Absorption Rates Assumed in Fiscal Impact Analysis: <br> - Proposed Project - $\mathbf{3 0 , 0 0 0}$ square feet per year <br> - 1981 Specific Plan - 30,000 square feet per year <br> ■ General Plan Scenario - 60,000 square feet per year |  |  |  |  |

*GAFO = General Merchandise, Apparel, Furniture/Appliances, Other/Specialty Source: TNDG, See Appendix C.

As shown above in Table 3-2, the low scenario assumes that the site would capture $7.5 \%$ of citywide retail demand, while the high scenario assumes it would capture $17.5 \%$. Regional/showroom retail space typically accounts for approximately $15 \%$ to $20 \%$ of total retail demand in most retail markets. Thus, the low scenario assumes the site could capture roughly $50 \%$ of this regional/showroom retail demand. In contrast, the high scenario assumes that the site would capture the majority of City regional/showroom retail demand, given the favorable site location characteristics (e.g., highway orientation and visibility).

## 4 Residential

Housing development at the site is assumed to be at a density greater than single family; but the actual configuration of the developed housing is subject to the considerations listed below, among others. The configuration used will greatly influence the amount of land consumed for this purpose, absorption rates, and other conditions.

- New single family housing being developed in and around Ontario has average low and average high prices that range from $\$ 527$ thousand to $\$ 593$ thousand. 9 Well-located condominium housing units priced at approximately $\$ 250,000$ should therefore be very marketable ${ }^{10}$. (Ontario also has a number of planned single family projects within its boundaries, with prices currently unknown.)
- Housing could, theoretically at least, be developed at higher density at the site than perhaps elsewhere in the city, assuming projects could be attractive enough in terms of general location, site amenities, reasonably accessible urban-support functions, and other considerations. However, costs per unit will tend to increase as densities increase beyond a certain base level, due to construction requirements if nothing else; although this will conserve land.
- Since the bulk of the site is intended to be developed in employment uses, having such uses close by can add to the attractiveness of housing, but could also detract depending on how the employment-use types are distributed and configured. In the same sense, the proximity of housing could make the employment areas more attractive to those users, but it could also detract if employers are concerned about residential-industrial compatibility issues.

Comprehensive consideration of all these issues would entail a fairly detailed analysis process; consequently for purposes of this report TNDG generated a residential analysis based on the following assumptions:

- The density of the residential product is similar for all scenarios: an average of 40 units per acre. This is reasonable for all scenarios, given that the site is a logical location for this kind of density, and the different mix of uses in the different scenarios can each accommodate this density. 11

[^6]This density assumption is compatible with the other studies done for the site and reviewed for this analysis.

- The assumed density allows projects to be built efficiently and cost-effectively, using economical construction techniques and configurations that are common within the market (e.g. 4-5 stories maximum in height). Consequently, the pricing of these units would be generally competitive within the local market.
- Both condominium and apartment projects are compatible with this type of density and would be developed at the site (including projects initially developed as apartments that are designed for eventual conversion to condos.). The assumed mix of apartments/condos for analysis purposes will reflect Ontario's current mix of rental/owner-occupied units and other housing data such as mix of units by type of configuration.
- Although housing of this density is not currently common in Ontario or the surrounding region, it will become increasingly so in response to the need for affordable housing and limited land supply in comparison to the demand in this growing area.

Average rents/prices of units were estimated based primarily on advertised apartment rental rates, for projects/units deemed to be reasonably comparable to those expected at the site. (Data on rentals were limited, and both Ontario and the surrounding region were investigated for comparable properties. No comparable condominium projects could be identified.) The average apartment rental rate used for analysis purposes was estimated to be $\$ 1,500$ per month, based on an assumed mix of studio, 1bedroom, and 2 -bedroom units of 25,50 , and 25 percent, respectively. To estimate an average condominium price of $\$ 255,000$, the estimated average rent was transposed to a net value, annualized, and capitalized, using the same factors employed by the Concord Group in their report for the Meredith site. (Data sources include: Concord Report, US Census, www.apartments.com, TNDG.)

### 4.1 Number and absorption of residential units at the site

Absorption of residential units at the site was considered from multiple factors. The three reports that previously addressed the Meredith site, referenced above, were reviewed for their findings and recommendations regarding housing units and absorption. Keyser Marston (using population projections from a Beacon Economics report) projected that 2,130 to 3,200 units could be absorbed at the site over 20 years, with 500 to 1,000 within 10 years. Beacon projected 1,535 units at the site within $5-7$ years, and Concord 690 units in 10 years. The SCAG projections for the TAZ that matches the site area showed only modest population growth there, 262 additional households by 2035 (see Table 4-1, below).

TNDG projected absorption based on capture at the site of a fixed percentage of Ontario's projected citywide household growth according to SCAG. The estimated capture rate was based on consideration of a combination of factors including the current percentage of housing units in the city that are rentals ( $42 \%$, relatively high), the current mix of housing units by single family or multi-family ( $30 \%$ multifamily), indications of pent-up demand for housing in the city (over 30,000 jobs housed within Ontario
must be filled by workers from outside the city; see Table 4-2), and the existence of the major competitive project, New Model Colony.

SCAG projections at both the city and TAZ (Transportation Analysis Zone) level were reviewed for the extent to which they could inform this analysis. Based on the SCAG 2012-2035 forecast data by TAZ, Table 4-1 (below) includes the projected households for the TAZ area that is in close alignment with the Meredith Site (shown below on Figure 4-1). According to SCAG projections, households within the Meredith Site are projected to increase from 122 in 2008 to only 254 in 2020 and 450 by 2035, which indicates that the allocations basically do not anticipate meaningful housing development in the site area.

As shown on Table 4-1 (below), using a capture rate of 20\% percent, which seems conservative, the Meredith site could add 1,310 units by 2020, and 395 units per year thereafter, through 2035.

Figure 4-1. SCAG TAZ Alignment with Meredith Site

The following (Table 4-2, below) illustrates the employment-heavy conditions within Ontario. According to US Census OnTheMap data, the City has 87,073 jobs and 54,834 workers living in Ontario. That results in a net inflow of over 32,000 commuters into Ontario, for which housing could in theory be supplied within the city.

Table 4-2. OnTheMap Employment Summary

|  | Count |
| :--- | ---: |
| Employed in the Selection Area | 87,073 |
| Workers Living in the Selection Area | 54,834 |
| Net Job Inflow (+) or Outflow (-) | $+32,239$ |

## Appendix A notes:

(1) The analysis indicates there is a significant surplus of retail sales in the market area. New residential units will help create additional demand; however, the demand from these units will support only a finite amount of retail.
(2) New retail and residential space are significantly larger than envisioned by either of the two plans (City \& Sares-Regis). Site will be absorbed 5- to 7-years
(3) Based on retail leakage/surplus analysis projection data which accounts for retail expenditures, sales, opportunity gap/surplus and potential SF to capture retail opportunity. There is leakage in car sales but is not included in analysis.
(4) Differs from total figure in report.
(5) US Energy Information Administration (EIA), Concord referenced this.
(6) Industrial - Factor comparison from Beacon Report and includes S-R report and the City's report. Source: Beacon Economics

[^0]:    ${ }^{1}$ SCAG Profile of the City of Ontario, May 2013.

[^1]:    ${ }^{2}$ Which included, among other procedures, calibrating the following within the TNDG demand model: employment density factors, mix of industrial-space-use activities among economic sectors, figures for total industrial space inventory and absorption from other sources, and data for industrial development factors from other TNDG projects.
    ${ }^{3}$ The square-feet-per-worker factors applied in this analysis vary from those utilized in The Ontario Plan (TOP) buildout calculations. The TOP calculations assumed 350 square feet per employee for office and 1,538 square per employee for all industrial land uses. Based on extensive research on this issue over the past 15 years (including a widely-cited study completed for the Southern California Association of Governments), TNDG believes that, historically, an "industry standard" factor for office absorption was 200-250 square feet per employee. However, recent studies on changing office-use trends strongly suggest that, for new space particularly, 175 square feet per employee is more realistic. Figures for industrial use are more problematic due to widening variations in how buildings are used, the degree of automation, changing trends in logistics, etc. This analysis uses figures that TNDG believes to be most realistic from a forecasting point of view; although with all the variables of use mix, activities in individual buildings, and other conditions, actual experience could be different from the projections.

[^2]:    ${ }^{4}$ Although the Meredith site is technically closer to the Airport, the CBBA area is close enough to the Airport that, as a practical matter, most office tenants for which convenient airport access is important will not make a significant distinction between the two locations.

[^3]:    ${ }^{5}$ Dean Runyon Associates, California Travel Impacts, 2013.

[^4]:    ${ }^{7}$ Based on taxable sales data from the California State Board of Equalization (SBOE). See Appendix C, Table 8.

[^5]:    ${ }^{8}$ See "Total Space" line on Table 3-2.

[^6]:    ${ }^{9}$ Data from NewHomeSource.com, for 10-mile radius centered on Ontario.
    ${ }^{10}$ The primary purpose of TNDG's market analysis is to forecast the number of units (rather than unit prices) that could potentially be absorbed at the Meredith site. Nevertheless, for purposes of the fiscal impact analysis, TNDG estimated an average condominium sales price of $\$ 255,000$, based on data/factors in the Concord Group study prepared for the Meredith property.
    ${ }^{11}$ For example, the General Plan scenario, the most densely developed, has 2,958 housing units, which would require 74 acres at 40 units/acre; the 4.4 million square feet of office space in this plan, the primary use, could be built on 41 acres at an average FAR (floor area ratio) of 2.5 ( 3 or more stories), the hotels on 7 acres at an average FAR of 3 , and the 2.2 million square feet of retail space on the remaining 119 acres of the 241- (usable) acre site at an average density of 0.42 FAR, which would require that some of the retail space be serviced by parking garages.
